Total IT Assessment

Altius IT's assessments identify the areas that deliver the most value for your organization. By identifying and quantifying IT related strengths and weaknesses, we deliver bottom line results. Altius IT's assessments include:

- Network assessments
- **Security assessments**
- Penetration assessments
- Web application and database assessments
- Web site assessments
- Risk assessments

Pick one assessment a combination of any of the above. Our Total IT Assessment is a comprehensive review of your technology, people, and processes and includes all of the above assessments.

Get Started On Advanced Security

Security Assessments

Altius IT security assessments protect your systems from internal and external threats and help your organization identify, manage, and reduce your risks.

50 Point Work Plan

Altius IT's security assessment is customized to your specific needs. Our services review and analyze 50+ different subject areas including:

- *IT systems* - hardware, software, and external services
- *People* - internal and external IT resources
- *Processes* - policies, procedures, and guidelines

Our analysis includes a review of the physical environment, firewall configurations, remote connectivity, server software, backups, software configurations, and patch management timing, testing, and rollouts.

We review software that maintains the integrity of your data - anti-virus, anti-spyware, anti-spam and phishing software. We evaluate inappropriate uploading and downloading of files and documents.

Information Confidentiality

Altius IT reviews and analyzes internal and external access to confidential financial and payroll systems. We examine access to documents including information storage, archiving, destruction, and related security procedures and controls.

Vulnerabilities

We review and identify:

- *Software vulnerabilities* - cyber attacks are made possible by exploiting flaws in known software vulnerabilities. To minimize your software related vulnerabilities, we review your patch management processes, testing, and software rollouts.
- *Misconfigurations* - a recent analyst report indicates that more than 65 percent of security vulnerabilities in an organization are the result of system misconfiguration. We review and analyze your network security to identify configuration errors.
- *Policy violations* - strong security requires operational diligence driven by the requirements of policy and processes. We minimize your risks.
